Paper Validation Report
for **LADS**

Correspondence: No
Percentages: 40.0%

Conclusion:

The repository contains core components of a multi-AutoML, LLM-driven system (code-generation agents, Fedot and LightAutoML back-ends, metric extraction, limited ROC-AUC/R2 evaluation), matching the high-level method in the paper. However, scripts or notebooks that actually run the eight Kaggle competitions, compute the paper's Normalized Performance Score, compare GPT-4o vs GigaChat2Max, and reproduce Tables 1–2 are absent. Dataset download, split logic, and NPS calculation are not implemented, and no stored results are provided. Thus only partial methodological alignment is present and the experimental claims cannot be reproduced from the code alone.
